COMPANY PROFILE

BP Pipelines (North America), Inc is one of the largest liquids pipeline companies in the U. S. transporting over 450 million barrelmiles of oil, refined products, natural gas liquids, carbon dioxide, and chemicals daily – about 9 percent of the U.S. Liquids pipeline market. Beyond our core operations, we participate in various joint venture pipelines and operate several.

COMMITMENT TO SAFETY, HEALTH & ENVIRONMENT

BP Pipelines (North America), Inc. is committed: no accidents, no harm to people and no damage to the environment. To ensuring safe operation of our pipelines by providing the public, excavators, emergency officials, public officials, and other interested parties with meaningful information about the location and operation of our pipelines and the products we transport. BP’s Public Awareness and Damage Prevention Programs are designed to develop long standing and mutually beneficial relationships with those who live or work near our pipeline.

- Pipeline operating conditions are monitored 24 hours a day, seven days a week by personnel in our Tulsa Control Center using a Supervisory Control and Data Acquisition (SCADA) computer system. This electronic surveillance system gathers such data as pipeline pressures, volume and flow rates, the status of pump stations and valves. Whenever operating conditions change, an alarm warns the operator on duty and the condition is investigated. Both automated and manual valves are strategically placed along the pipeline system to enable the pipeline to

be shutdown immediately and sections to be isolated quickly, if necessary.

- Visual inspections of BP’s pipeline right-of-ways are conducted by air and/or ground per 49 CFR 195.412. Above ground marker signs are displayed along the right-of-ways to alert the public and contractors to the existence of our pipelines.
- Internal inspections are conducted periodically by passing sophisticated computerized equipment called “smart pigs” through our pipelines.
- Cathodic protection is a technology designed to protect pipelines from external corrosion through the use of an electrostatic current. The small electrical charge is applied to our pipelines, which have an external protective coating.
- BP’s public awareness and damage prevention program is designed to prevent third-party damage to our pipelines. Additionally, BP is a member of and/or participant of numerous damage prevention associations and a member of the “one-call” systems in every state in which we have pipeline facilities, which are designed to help the public,

COUNTIES OF OPERATION:**

Clayton	Fayette	Winnesheik
Delaware	Lee	
Dubuque	Howard	

Changes may occur. Contact the operator to discuss their pipeline systems and areas of operation.

contractors and others identify the location of pipelines prior to excavation projects to prevent damage to pipelines and protect the public. The leading cause of pipeline accidents is third-party damage caused by various types of excavation activities.

- Emergency preparedness and planning measures are in place at BP in the event that a pipeline incident occurs. The company also works closely with local emergency response organizations to educate them regarding our pipelines and how to respond in the unlikely event of an emergency.
- BP has contractors (ie Heritage Environmental) available to respond to an incident, and maintains emergency spill trailers at strategic locations on our system. On-site communications equipment includes cell phones, satellite phones and land-lines to offices. BP employees have been trained extensively in the Incident Command System.

Pipelines are the most efficient and safest method by which to transport refined petroleum products and they are inherently safer than other modes of transportation such as rail, barge and truck.
